

DevOps Certification

Training Certification Project –02

Finance Me - Banking and Finance Domain

The company's goal is to deliver the product updates frequently to production with High quality & Reliability. They also want to accelerate software delivery speed, quality and reduce feedback time between developers and testers.

Following are the problems the company is facing at the moment

- ✓ Building Complex builds is difficult
- ✓ Manual efforts to test various components/modules of the project
- ✓ Incremental builds are difficult to manage, test and deploy
- ✓ Creation of infrastructure and configure it manually is very time consuming
- ✓ Continuous manual monitoring of the application is quite challenging.

In order to implement a POC, you are requested to develop a Mavenised microservice using spring boot and in memory h2 database.

1. A microservice which exposes below mentioned endpoints as APIs and uses in memory h2 database to store the data.

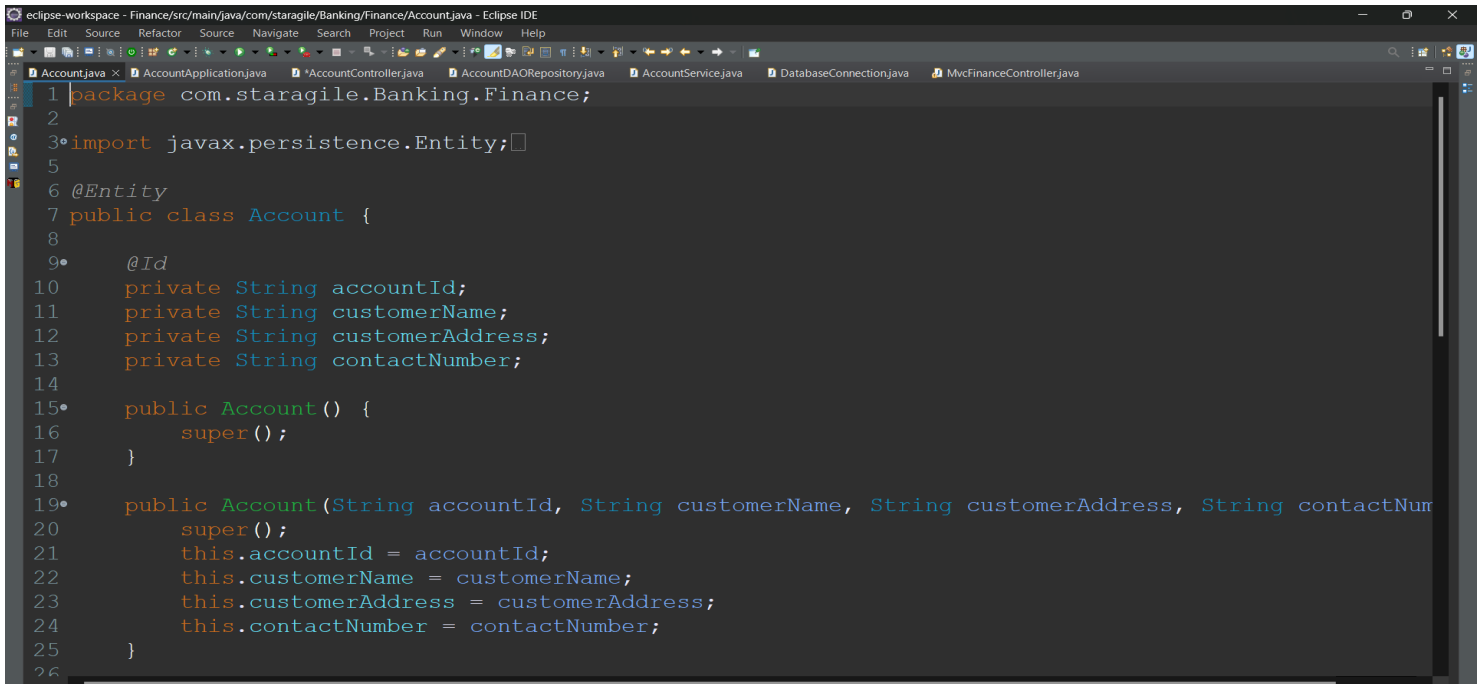

- a. /createAccount (HTTP Method : POST) (Request Body : JSON)
- b. /updateAccount/{account no.} (HTTP Method : PUT) (Request Body : JSON)
- c. /viewPolicy/{account no.} (HTTP Method : GET) (No Request Body)
- d. /deletePolicy/{account no.} (HTTP Method : DELETE) (No Request Body)

- ❖ Here I wrote the code with Junit test cases & added maven dependencies for the application using eclipse IDE and pushed it to the github repository.

<https://github.com/Dilipkumar-M/FinanceMe>

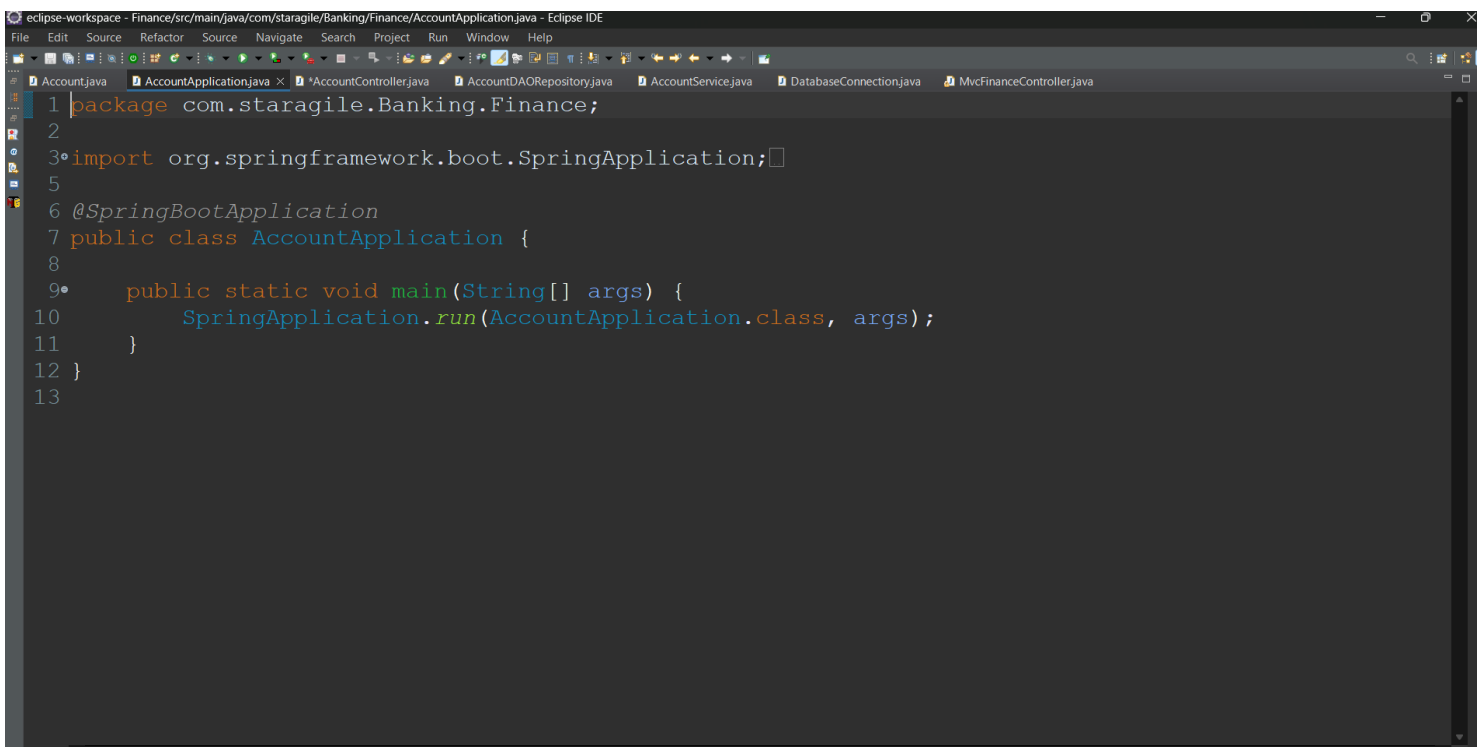

1. A microservice which exposes below mentioned endpoints as APIs and uses pre configured AWS RDS – mysql database to store the data.

- a. /createAccount (HTTP Method : POST) (Request Body : JSON)
- b. /updateAccount/{account no.} (HTTP Method : PUT) (Request Body : JSON)
- c. /viewPolicy/{account no.} (HTTP Method : GET) (No Request Body)
- d. /deletePolicy/{account no.} (HTTP Method : DELETE) (No Request Body)

The screenshot shows the Eclipse IDE with the 'Account.java' file open. The code defines a JPA entity for an account. It includes package declarations, imports, and annotations like @Entity and @Id. The class has private fields for account details and two constructors: a no-arg constructor and a parameterized constructor.

```
1 package com.staragile.Banking.Finance;
2
3 import javax.persistence.Entity;
4
5
6 @Entity
7 public class Account {
8
9     @Id
10    private String accountId;
11    private String customerName;
12    private String customerAddress;
13    private String contactNumber;
14
15    public Account() {
16        super();
17    }
18
19    public Account(String accountId, String customerName, String customerAddress, String contactNum
20        super();
21        this.accountId = accountId;
22        this.customerName = customerName;
23        this.customerAddress = customerAddress;
24        this.contactNumber = contactNumber;
25    }
26
```

The screenshot shows the Eclipse IDE with the 'AccountApplication.java' file open. The code is a Spring Boot application that uses the SpringApplication class to run the application. It includes package declarations, imports, and the @SpringBootApplication annotation. The main method is a static void method that calls SpringApplication.run().

```
1 package com.staragile.Banking.Finance;
2
3 import org.springframework.boot.SpringApplication;
4
5
6 @SpringBootApplication
7 public class AccountApplication {
8
9    public static void main(String[] args) {
10        SpringApplication.run(AccountApplication.class, args);
11    }
12 }
13
```

```

34     }
35 }
```

```
1 package com.staragile.Banking.Finance;
2
3 import java.sql.Connection;
4
5
6
7 public class DatabaseConnection {
8     public static void main(String[] args) {
9         Connection conn = null;
10        try {
11            // Establish a connection to the H2 database
12            conn = DriverManager.getConnection("jdbc:h2:file:C:/Users/user/test", "dilip", "dilip");
13
14            // Perform database operations here
15            // You can execute SQL queries using this connection.
16
17            // Close the connection when done
18            conn.close();
19        } catch (SQLException e) {
20            e.printStackTrace();
21        }
22    }
23 }
24
```

Here I wrote the code for following endpoints mentioned in the question 1).

2. Write necessary Junit test cases.

In eclipse choose file→java project→new project→policytest→new policytest.java

```
1 package SeleniumProject.SeleniumProject;
2
3 import java.util.concurrent.TimeUnit;
4
5
6
7 Run All
8 public class BankingTest extends TestCase{
9
10    //download chrome driver from https://googlechromelabs.github.io/chrome-for-testing/
11    public String baseUrl = "http://localhost:8080/hello";
12    String driverPath = "E:\\chromedriver-win64\\chromedriver-win64\\chromedriver.exe";
13
14    public WebDriver driver;
15
16    @Test
17    Run | Debug
18    public void testGoogle() {
19        // set the system property for Chrome driver
20        System.out.println("inside testGoogle");
21        System.setProperty("webdriver.chrome.driver", driverPath);
22        System.out.println("inside testGoogle "+driverPath);
23        // Create driver object for CHROME browser
24        driver = new ChromeDriver();
25        driver.manage().timeouts().implicitlyWait(20, TimeUnit.SECONDS);
26        driver.manage().window().maximize();
27        driver.get(baseUrl);
28    }
29 }
```

4. Push your code into your GitHub Repository

```

Here I pushed the application source code into my Github repository repo link is mentioned below:

<https://github.com/Dilipkumar-M/FinanceMe>

5. Implementing CI/CD in the aws instance.

Here I implemented Continuous Integration & Continuous Deployment of the application using DevOps tools like, Jenkins, Git, Docker, aws, Maven, Java. all these tools are configured with terraform and launched the Jenkins-instance from the local machine through aws configure using the accesskey and the secret key from the IAM security policies, and configured jenkins permissions to access the docker and the push image to dockerhub.

Files which are needed to start terraform:-

❖ **Compute.tf**

```
resource "aws_instance" "jenkins-instance" {
  ami          = var.instance_ami #ubuntu ami for N.virginia region.
  instance_type = var.instance_type
  key_name      = var.keyname
  #user_data = file("install_jenkins.sh")
  associate_public_ip_address = true
  tags = {
    Name = "Jenkins-Instance"
  }
```

❖ **main.tf**

```
provider "aws" {
  region          = "${var.region}"
  shared_credentials_files = ["~/.aws/credentials"]
}
```

❖ **terraform.tfvars**

```
region = "us-east-1"
instance_type = "t2.medium"
instance_ami = "ami-032df771421fcffbd"#"ami-053b0d53c279acc90"
keyname = "awsLinux"
```

❖ **variables.tf**

```
variable "region" {
  default = "us-east-1"
```

```

}
variable "instance_type" {

}
variable "instance_ami" {

}
variable "keyname" {
  default = "awsLinux"
}

```

Follow the commands to start the aws instance from the local machine:

In, terraform folder→terraform init→terraform plan→terraform apply→terraform destroy.

Terraform init

```

Dilip@Dilipkumar MINGW64 /e/Banking/terraform (main)
$ terraform init

Initializing the backend...

Initializing provider plugins...
- Reusing previous version of hashicorp/aws from the dependency lock file
- Using previously-installed hashicorp/aws v5.21.0

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.

```

Terraform plan

```

Dilip@Dilipkumar MINGW64 /e/Banking/terraform (main)
$ terraform plan

Terraform used the selected providers to generate the following execution
plan. Resource actions are indicated with the following symbols:
  + create

Terraform will perform the following actions:

# aws_instance.Terraform_handson will be created
+ resource "aws_instance" "Terraform_handson" {
  + ami                  = "ami-032df771421fcffbd"
  + arn                  = (known after apply)
  + associate_public_ip_address = true
  + availability_zone     = (known after apply)
  + cpu_core_count       = (known after apply)
  + cpu_threads_per_core  = (known after apply)
  + disable_api_stop      = (known after apply)
  + disable_api_termination = (known after apply)
  + ebs_optimized         = (known after apply)

```

```

    + volume_type          = (known after apply)
  }
}

Plan: 1 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?
  Terraform will perform the actions described above.
  Only 'yes' will be accepted to approve.

  Enter a value: yes

aws_instance.Terraform_handson: Creating...
aws_instance.Terraform_handson: Still creating... [10s elapsed]
aws_instance.Terraform_handson: Still creating... [20s elapsed]
aws_instance.Terraform_handson: Still creating... [30s elapsed]
aws_instance.Terraform_handson: Still creating... [40s elapsed]
aws_instance.Terraform_handson: Creation complete after 48s [id=i-05bca61db79b0a69b]

Apply complete! Resources: 1 added, 0 changed, 0 destroyed.

```

Terraform apply

```

Dilip@Dilipkumar MINGW64 /e/Banking/terraform (main)
$ terraform apply

Terraform used the selected providers to generate the following execution
plan. Resource actions are indicated with the following symbols:
  + create

Terraform will perform the following actions:

# aws_instance.Terraform_handson will be created
+ resource "aws_instance" "Terraform_handson" {
  + ami                     = "ami-032df771421fcffbd"

+   + device_name = "/dev/sda1"
+   + encrypted = (known after apply)
+   + iops = (known after apply)
+   + kms_key_id = (known after apply)
+   + snapshot_id = (known after apply)
+   + throughput = (known after apply)
+   + volume_id = (known after apply)
+   + volume_size = 20
+   + volume_type = (known after apply)
+ }
}
```

Plan: 1 to add, 0 to change, 0 to destroy.

Note: You didn't use the -out option to save this plan, so Terraform can't guarantee to take exactly these actions if you run "terraform apply" now.

Aws instance created using terraform

| | | | | | | | | | |
|-------------------------------------|-------------------|-------------------|---------|-----------|-----------------|-----------|------------|--------------------|---------------|
| <input checked="" type="checkbox"/> | Terraform_handson | i-05bca61db79... | Running | t2.medium | Initializing... | No alarms | us-east-1d | ec2-54-80-225-1... | 54.80.225.120 |
| <input type="checkbox"/> | Master | i-0a63c26ffa07... | Stopped | t2.micro | - | No alarms | us-east-1b | - | - |
| <input type="checkbox"/> | Slave | i-0356355398c... | Stopped | t2.micro | - | No alarms | us-east-1b | - | - |

Above image shows how terraform created the Terraform-hands on instance which includes all the tools mentioned.

After initialization of the Jenkins-instance with terraform from the local machine, connect it to run the job of CICD with jenkins and docker to produce images from the container.and push it to the docker hub.

Here are the commands given in the form of shell script to the terraform folder to execute within the aws Virtual machine to install all the required Devops tools for the initial process.

```
#!/bin/bash
```

```
sudo apt update -y && apt upgrade -y
```

```
echo "Install Java JDK 8"
```

```
sudo apt remove -y java
```

```
sudo apt install default-jdk -y
```

```
echo "Install Maven"
```

```
sudo apt install maven -y
```

```
echo "Install git"
```

```
sudo apt install -y git
```

```
echo "Install Docker engine"
```

```
curl -fsSL https://get.docker.com -o get-docker.sh
```

```
sudo sh get-docker.sh
```

```
#sudo usermod -a -G docker jenkins
```

```
#sudo service docker start
```

```
#sudo chkconfig docker on
```

```
echo "Install Jenkins"
```

```
curl -fsSL https://pkg.jenkins.io/debian-stable/jenkins.io-2023.key | sudo tee  
/usr/share/keyrings/jenkins-keyring.asc > /dev/null
```

```
echo deb [signed-by=/usr/share/keyrings/jenkins-keyring.asc]
```

```
https://pkg.jenkins.io/debian-stable binary/ | sudo tee /etc/apt/sources.list.d/jenkins.list >  
/dev/null
```

```
sudo apt-get update -y
```

```
sudo apt-get install fontconfig -y
```

```
sudo apt-get install jenkins -y
```

After running this script the tools were automatically installed in the respective virtual machine that have we chosen

After accessing the Jenkins server, choose the Freestyle job and provide the GitHub project configuration. Grant git access to Jenkins to run continuous integration, and change permissions to configure the Docker user. Run the below commands, and also add Git SCM webhooks to the job.

After adding the webhooks to the Jenkins job this webhooks alerts the developer with notifications whenever the source code of the project is deployed by users or the developers, then builds the CI/CD.

Commands as script in ShellExecution to do a job:

```
mvn clean install
docker build -t java-web-app-cicd:latest .
if (docker ps -a | grep 'java-web-app-cicd')
then
    docker stop java-web-app-cicd
    docker rm -f java-web-app-cicd
fi
docker run -d -p 8888:8080 --name java-web-app-cicd java-web-app-cicd
mvn test
docker login -u dilipkumar5656 -pdckr_pat_1foZ87ZAbTpjBKZgR9t242fAwlc
docker commit java-web-app-cicd dilipkumar5656/java-web-app-cicd:latest
docker push dilipkumar5656/java-web-app-cicd:latest
```

Add slave node centos

Nodes > CentosSlave1 > Log

```

Write a playbook to install some tools in the Frontend server.

```
dilip@ip-172-31-41-223: /home/ubuntu/SA-P02-FinanceMe
- name : Configure Docker on EC2 Instances
  hosts : all
  become: true
  connection : ssh
  tasks :
    - name: updating apt
      command : sudo apt-get update

    - name : Install Docker
      command : sudo apt-get install -y docker.io

    - name : Start Docker Service
      command : sudo systemctl start docker

    - name: Deploy Docker Container
      command: docker run -itd -p 8084:8081 dilipkumar5656/java-web-app-cicd:1.0
  ~
  ~
  ~
  ~
  ~
  ~
  ~
  ~
  ~
  ~
```

Docker installation in frontend server using scripts

```
See 'snap info <snapname>' for additional versions.
dilip@ip-172-31-41-223:/home/ubuntu$ sudo snap install docker
docker 20.10.24 from Canonical✓ installed
dilip@ip-172-31-41-223:/home/ubuntu$ docker --version
Docker version 20.10.24, build 297e128
```

```
Docker version 20.10.24, build 297e128
dilip@ip-172-31-41-223:/home/ubuntu$ docker run hello-world
docker: Got permission denied while trying to connect to the Docker daemon socket: connect: permission denied.
See 'docker run --help'.
dilip@ip-172-31-41-223:/home/ubuntu$ sudo docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
719385e32844: Pull complete
Digest: sha256:4f53e2564790c8e7856ec08e384732aa38dc43c52f02952483e3f003afbf230
Status: Downloaded newer image for hello-world:latest
```

Hello from Docker!
This message shows that your installation appears to be working correctly.

To generate this message, Docker took the following steps:

1. The Docker client contacted the Docker daemon.
2. The Docker daemon pulled the "hello-world" image from the Docker Hub. (amd64)
3. The Docker daemon created a new container from that image which runs the executable that produces the output you are currently reading.
4. The Docker daemon streamed that output to the Docker client, which sent it to your terminal.

To try something more ambitious, you can run an Ubuntu container with:
\$ docker run -it ubuntu bash

Share images, automate workflows, and more with a free Docker ID:
<https://hub.docker.com/>

For more examples and ideas, visit:
<https://docs.docker.com/get-started/>

```

Give permissions to the jenkins slave to configure with docker to push the images and restart both jenkins and docker.

```
sudo usermod -aG docker jenkins-centos
sudo systemctl restart docker
sudo systemctl restart jenkins
```

Add Webhook

The screenshot shows the GitHub repository settings for 'Dilipkumar-M / SA-P02-FinanceMe'. The 'Settings' tab is selected, and the 'Webhooks' section is active. A single webhook is configured with the URL 'http://54.80.225.120:8080/github-w... (push)'. The left sidebar contains a navigation menu with categories: General, Access (Collaborators, Moderation options), Code and automation (Branches, Tags, Rules, Actions), Webhooks (selected), Environments, Codespaces, Pages, Security (Code security and analysis, Deploy keys, Secrets and variables), and Integrations (GitHub Apps, Email notifications).

Webhooks

Webhooks allow external services to be notified when certain events happen. When the specified events happen, we'll send a POST request to each of the URLs you provide. Learn more in our [Webhooks Guide](#).

✓ http://54.80.225.120:8080/github-w... (push) Edit Delete

Add webhook

After all these processes the jenkins pushes automatically the image into the docker hub account repository.

Continuous monitoring setup is established ,by installing prometheus and grafana in jenkins server and node- exporter.

Install Docker-compose:

```
[root@ip-172-31-75-217 bin]# docker-compose
Define and run multi-container applications with Docker.

Usage:
  docker-compose [-f <arg>...] [options] [COMMAND] [ARGS...]
  docker-compose -h|--help

Options:
  -f, --file FILE            specify an alternate compose file
```

```
[root@ip-172-31-75-217 bin]# vi /etc/docker/daemon.json
[root@ip-172-31-75-217 bin]# vi /etc/docker/daemon.json
[root@ip-172-31-75-217 bin]# systemctl restart docker
[root@ip-172-31-75-217 bin]# systemctl status docker
● docker.service - Docker Application Container Engine
   Loaded: loaded (/usr/lib/systemd/system/docker.service; enabled; vendor preset: disabled)
```

```
{
  "exec-opts" : ["native.cgroupdriver=systemd"] ,
  "log-driver" : "json-file" ,
  "log-opts" : {
    "max-size" : "100m"
  },
  "storage-driver" : "overlay2",
  "metrics-addr" : "127.0.0.1:9323" ,
  "experimental" : true
}
```

The below monitoring is done on the Node-Exporter (Id=1860)

1. CPU utilization
2. Disk Space Utilization
3. Total Available Memory

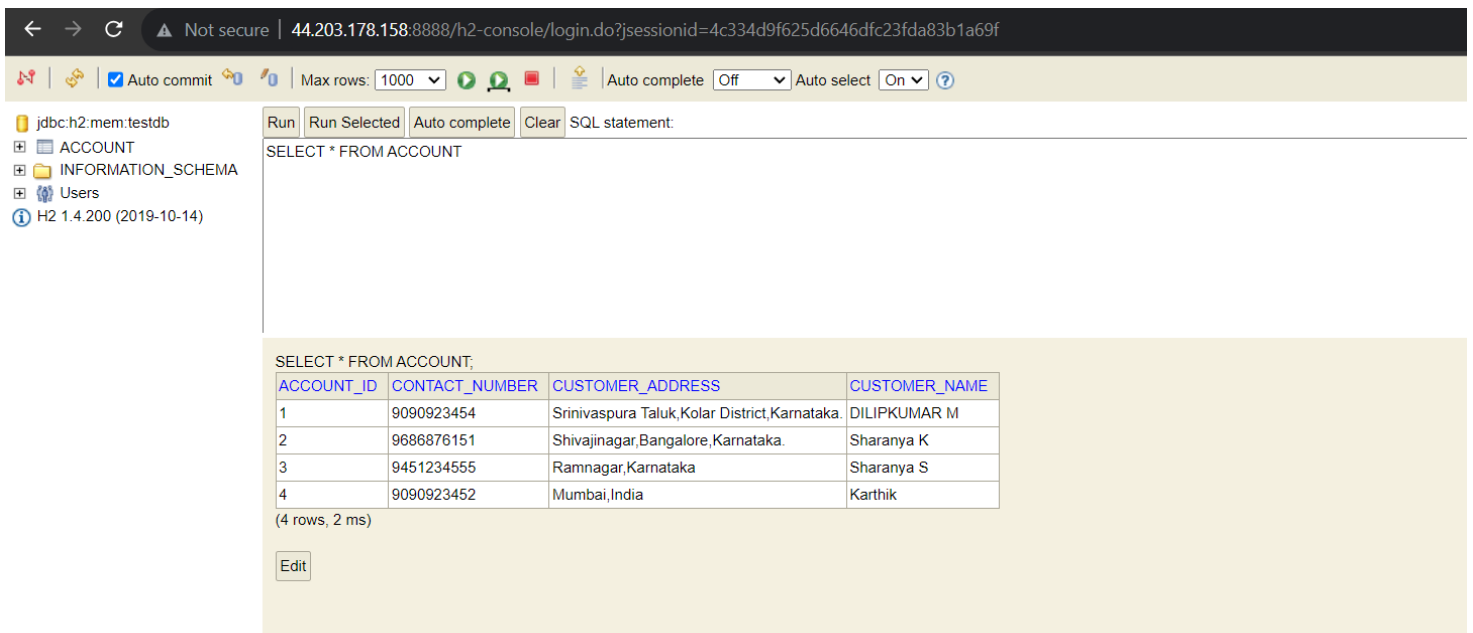

The below monitoring is done for the Jenkins-server (Id=306) which is having,

1. CPU utilization
2. Disk space Utilization
3. Total available Memory

At last the all database of customers that operated from the bank will be stored in the h2-console.

<http://44.203.178.158:8888/h2-console/login.do?jsessionId=4c334d9f625d6646dfc23fda83b1a69f>

The screenshot shows the H2 database console interface. The browser address bar displays the URL: `http://44.203.178.158:8888/h2-console/login.do?jsessionId=4c334d9f625d6646dfc23fda83b1a69f`. The console shows a SQL statement `SELECT * FROM ACCOUNT` executed successfully. The results are displayed in a table with 4 rows and 4 columns: `ACCOUNT_ID`, `CONTACT_NUMBER`, `CUSTOMER_ADDRESS`, and `CUSTOMER_NAME`. The data rows are:

| ACCOUNT_ID | CONTACT_NUMBER | CUSTOMER_ADDRESS | CUSTOMER_NAME |
|------------|----------------|--|---------------|
| 1 | 9090923454 | Srinivaspura Taluk, Kolar District, Karnataka. | DILIPKUMAR M |
| 2 | 9686876151 | Shivajinagar, Bangalore, Karnataka. | Sharanya K |
| 3 | 9451234555 | Ramnagar, Karnataka | Sharanya S |
| 4 | 9090923452 | Mumbai, India | Karthik |

The console also shows the execution time: (4 rows, 2 ms). The left sidebar shows the database structure: `jdbc:h2:mem:testdb`, `ACCOUNT`, `INFORMATION_SCHEMA`, and `Users`.
